Keep the grid stable

Dynamic topology optimization & converter tuning

TenSyGrid 1-day hackathon challenge

Universitat Politècnica de Catalunya · CETPartnership Horizon Europe (GA 101069750)

Power systems are rapidly transitioning towards inverter-dominated operation. This 1-day hackathon challenges teams to use the VeraGrid Python API to **minimize transmission losses** via topology switching while **preserving (and improving) small-signal stability** through converter control tuning. Submissions are scored automatically across multiple operating scenarios.

Date 26 November 2026
Time 09:00–17:00
Venue Sala InnoEnergy, UPC, Barcelona
Language English

Programme

Time	Session and milestone
09:00–09:15	**Hackathon kick-off:** Challenge presentation, stability criteria, and VeraGrid platform introduction.
09:15–11:00	**Welcome and sprint 1: Static grid and topology switching.** Team setup, onboarding with VeraGrid Python API, and line loss optimization.
11:00–11:30	*Coffee break.*
11:30–12:00	**Hackathon support:** Dedicated mentoring and technical Q&A with TenSyGrid consortium researchers.
12:00–13:00	**Sprint 2: Dynamic layer and converter control tuning.** Computing eigenvalues, modal analysis, and stabilizing critical oscillation modes.
13:00–14:00	*Lunch break.*
14:00–15:30	**Sprint 3: Automation and batch resilience.** Multi-scenario batch sweep across 300 test operating points and parameter optimization.
15:30–16:00	*Coffee break and code freeze.* Submission of final scripts to the automated scoring harness.
16:00–17:00	**Hackathon wrap-up and winners announcement:** Team presentations, live leaderboard reveal, and awards ceremony.
